

SSP Data Services

Solutions for the secure transfer of your corporate data.

Creating a fluid, efficient migration process is vital.

Your challenges.

Data is the lifeblood of every business and over time we collect a huge amount of it. So when it's time to move this valuable information from your existing system to another IT system, it needs to happen safely, seamlessly and cost-effectively, without disrupting day-to-day operations.

Data migration should also provide an opportunity to cleanse and discard any unwanted data and streamline operations – but often creates unwanted disruption. Creating a fluid, efficient migration process is vital.

Your solution: SSP Data Services.

Our dedicated SSP Data Services team specialises in the migration of data from existing broking systems – such as Open GI, Acturis, TAM, CDL and Brokasure – into your SSP system.

We understand the need for business continuity when migrating data between systems. That's why SSP Data Services supports data migration across many different timetables, including by branch, product or renewal date, so we always move at a pace with which you are comfortable and that reduces any risk and strain on your business. Very simply: we will work with you to find the quickest way to reap the benefits of your SSP system.

All SSP systems have been designed and built to be migration-ready. Consideration has been given to provide migration frameworks for each of the main components or areas of the relevant systems. Load processes are regularly benchmarked and tested to ensure that migration is conducted in the most efficient and effective manner possible.

A large, stylized red arrow graphic that starts from the bottom left and points towards the top right, curving upwards. It has a gradient from dark red to a lighter red.

Experience in equals progress out.

All SSP systems have been designed and built to be migration-ready.

Our approach.

SSP Data Services offers a functionally rich suite of components supported through a best-of-breed Extract, Transform and Load (ETL) tool to enable the collection of data mappings for successful conversion. This is designed to enable the direct transfer, transformation and derivation of data from one or more source systems, creating fully functioning representations of client, policy and policy-related data on a target system.

This provides standard reconciliation points throughout the conversion process to confirm that all valid converted data has been included, the financial controls in target are all in balance and referential integrity is maintained. This can be achieved in one go or phased by line of business, location or any other logical split.

Key benefits.

- Especially beneficial for organisations consolidating multiple legacy systems.
- Dramatically reduces the time and risk elements associated with this critical phase of system implementation.
